SUCTION UNIT

Suction is developed by a single phase, carbon brush by-pass motor which ensures rapid cooling in case of overheating. A solid plastic casing protects the motor from blows and the introduction of foreign elements and maintains noise level at a minimum.

FILTER UNIT

The polyester star filter with large filtration surface placed inside the filter chamber ensures protection from dust and avoids filter clogging.

COLLECTION UNIT

The suctioned dust and chips are deposited inside a container fitted with wheels, allowing fast disposal of the material.
